242 243 wilting of the grasses. Some, however, put too much water with the sprays, practicing a false economy (luki') by other Ibans' own estimates, so that the spraying is not effective and the task of weeding more difficult.

243 412 In most farms land still is cleared with ilok, pitu' and duku', and the cut grasses and stubble left to dry before being fired. The use of these conventional tools is due in part to a greater difficulty of access to the pasar in some cases, with a concomitantly greater cost in the cost of transporting materials. Another reason is that some farms are not cultivated more than two years in succession, then allowed to lie fallow an average of seven years, making clearing more difficult.

228 176 243 A novel development has been made by Tuai Rumah Asun who alternates a 22 acre site at 4½ miles Durin Road between rice and fish. In May, the pegong ikan ("fish pond") is drained and sold on the Sibu market. The grass in the pond is sprayed with herbicides and fired when dry, after which wet rice is planted. When the rice comes to head, the pond is dammed and stocked again with fry that grow, feeding on the rice, and are caught when the pond is drained at the beginning of the next farming year.

243 774 [221] Within two days of the full moon in June (keleman sahari dua udah bulan kembong) the rice-beds are planted. The life/death motif noted earlier in the concept of life beginning and ending with rice appears again in the language used for planting the rice-beds. The seed are interred (dikubor, lit., "entombed") that they may rise and give new life
